Inside The Story of Why Employees Leave

To transform employee data into predictive insights about workforce attrition

Team Name: Data Verse

Team Members :
Peddi Praharshita
Aerramalla Bhavya

what is Employee Attrition?

The steady outflow of employees from an organization over time.

Why does it Matter?

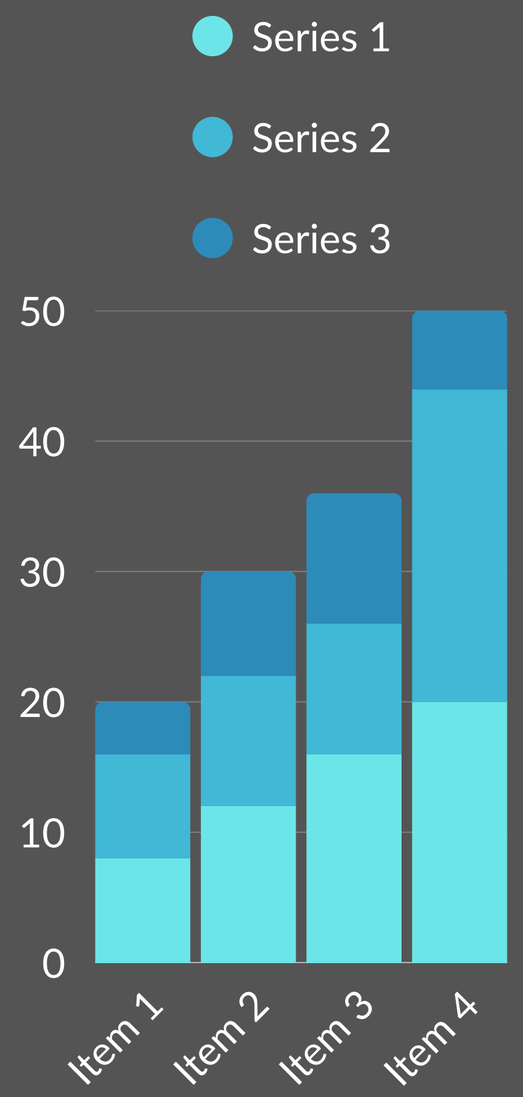
Teams lose experience, productivity drops, and companies spend more replacing talent.

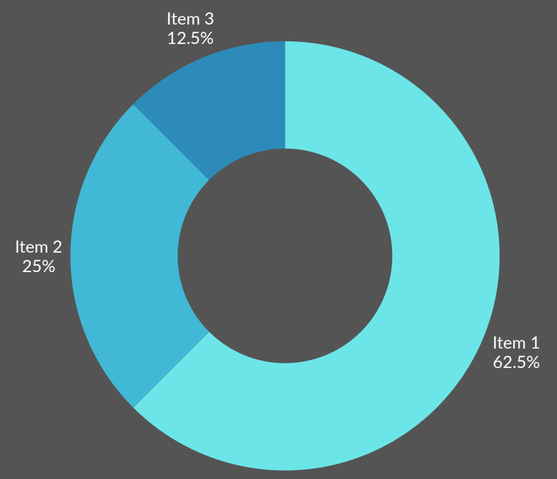
Our Ideation

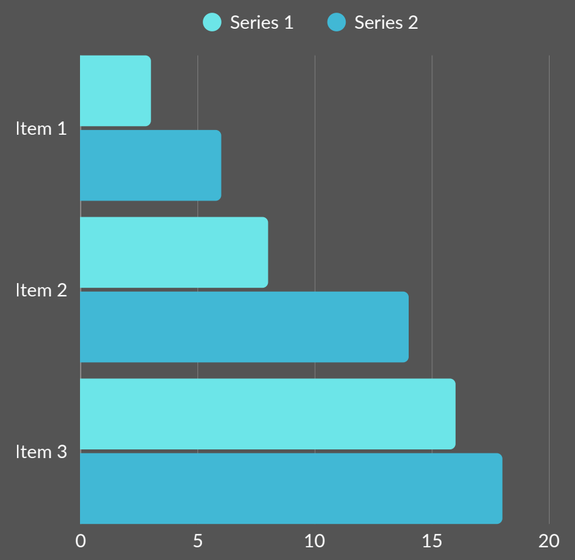
By examining HR data across roles, demographics, and work patterns, we can discover what leads employees to exit

Project Aim

To uncover the most influential factors contributing to attrition using Power BI analytics and machine learning feature insights.







Dataset Used

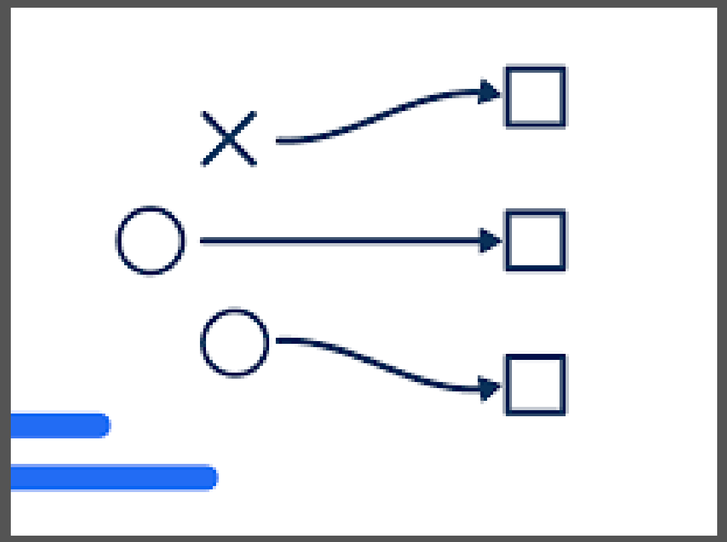
IBM HR Employee Attrition Dataset

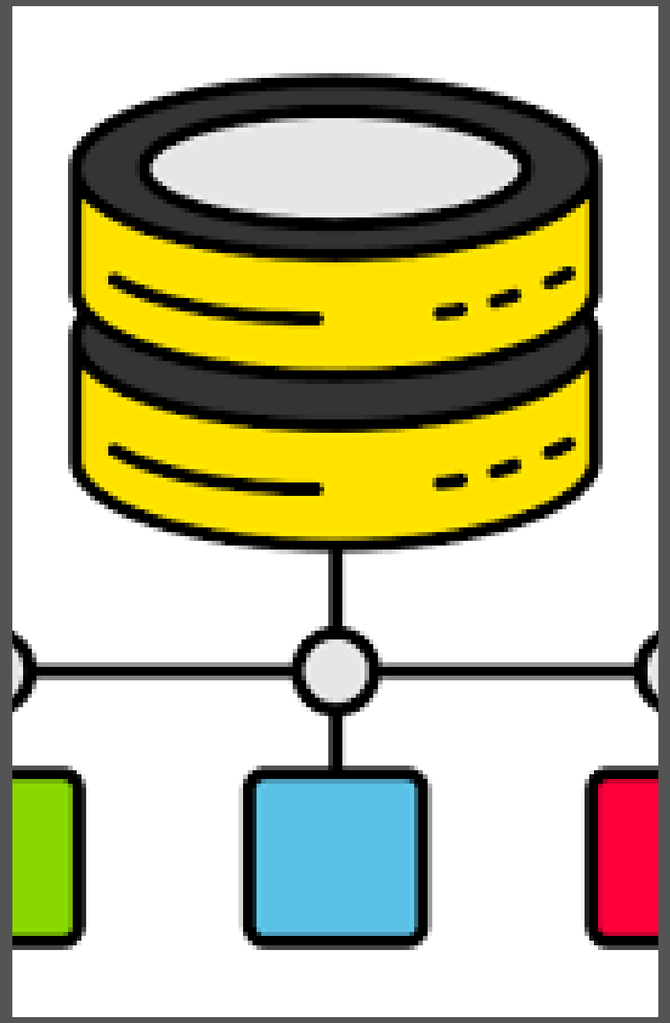
Dataset Size

- 1470 employee records
- 35 variables covering demographics, job details, performance, and separation status

Purpose

To examine how different employee characteristics relate to attrition and identify which attributes influence exits the most.





Data Categories Included

- Personal: Age, Gender, Marital Status
- Job Details: Role, Department, Travel, Job Level
- Experience: Years at Company, Years in Current Role, Promotions
- Work Conditions: Distance, Overtime, Work-life Balance
- Satisfaction Scores: Environment, Relationship, Job Involvement
- Attrition Label: Yes / No

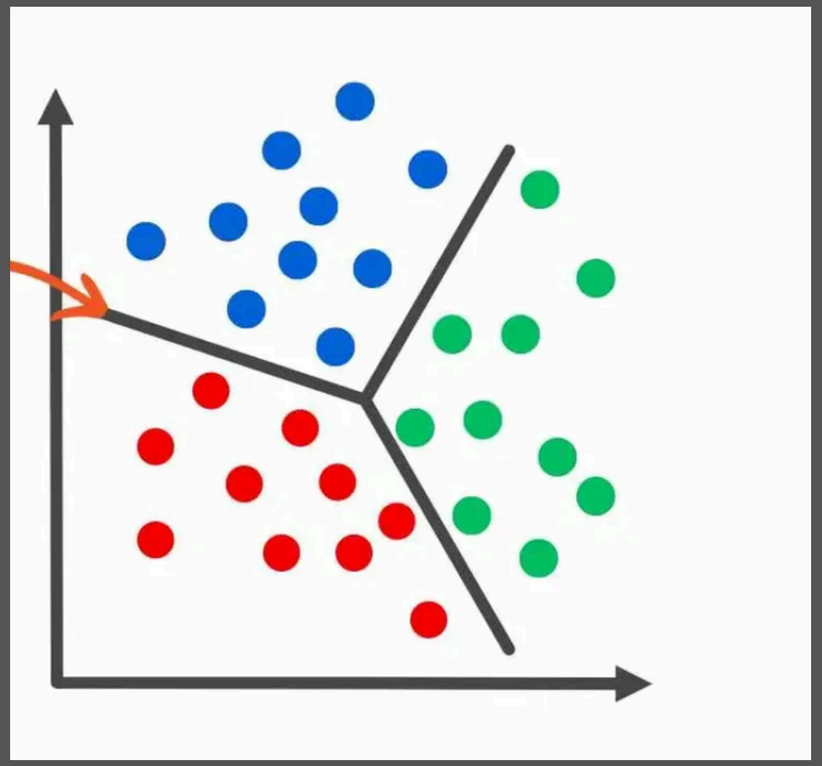
Models Implemented

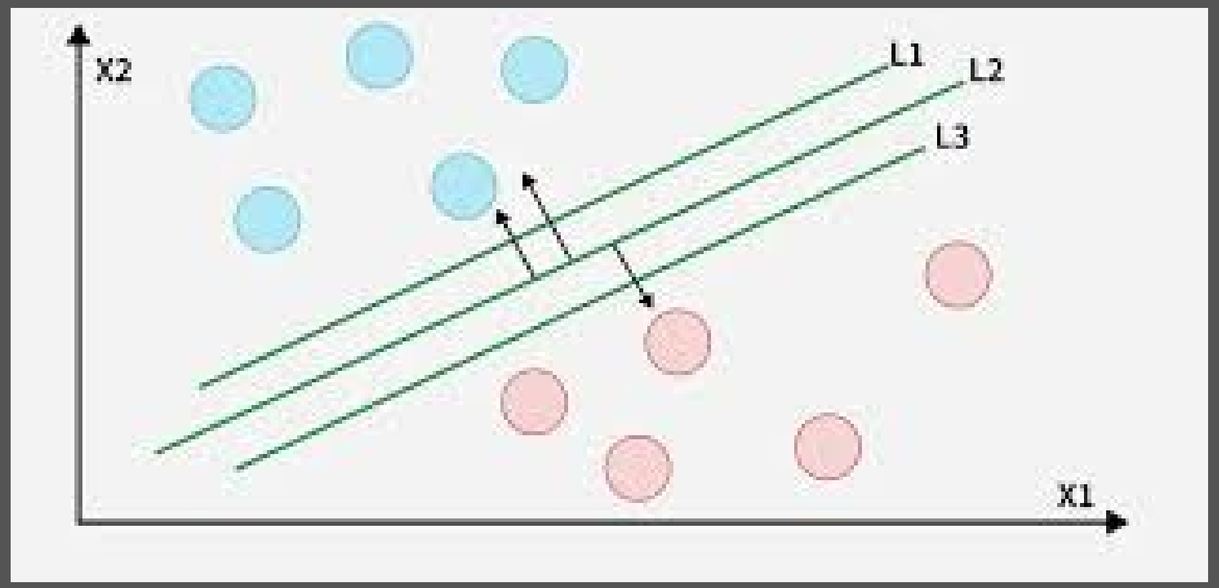
Logistic Regression, CatBoost, XGBoost, Random Forest, Support Vector Machine (SVM)

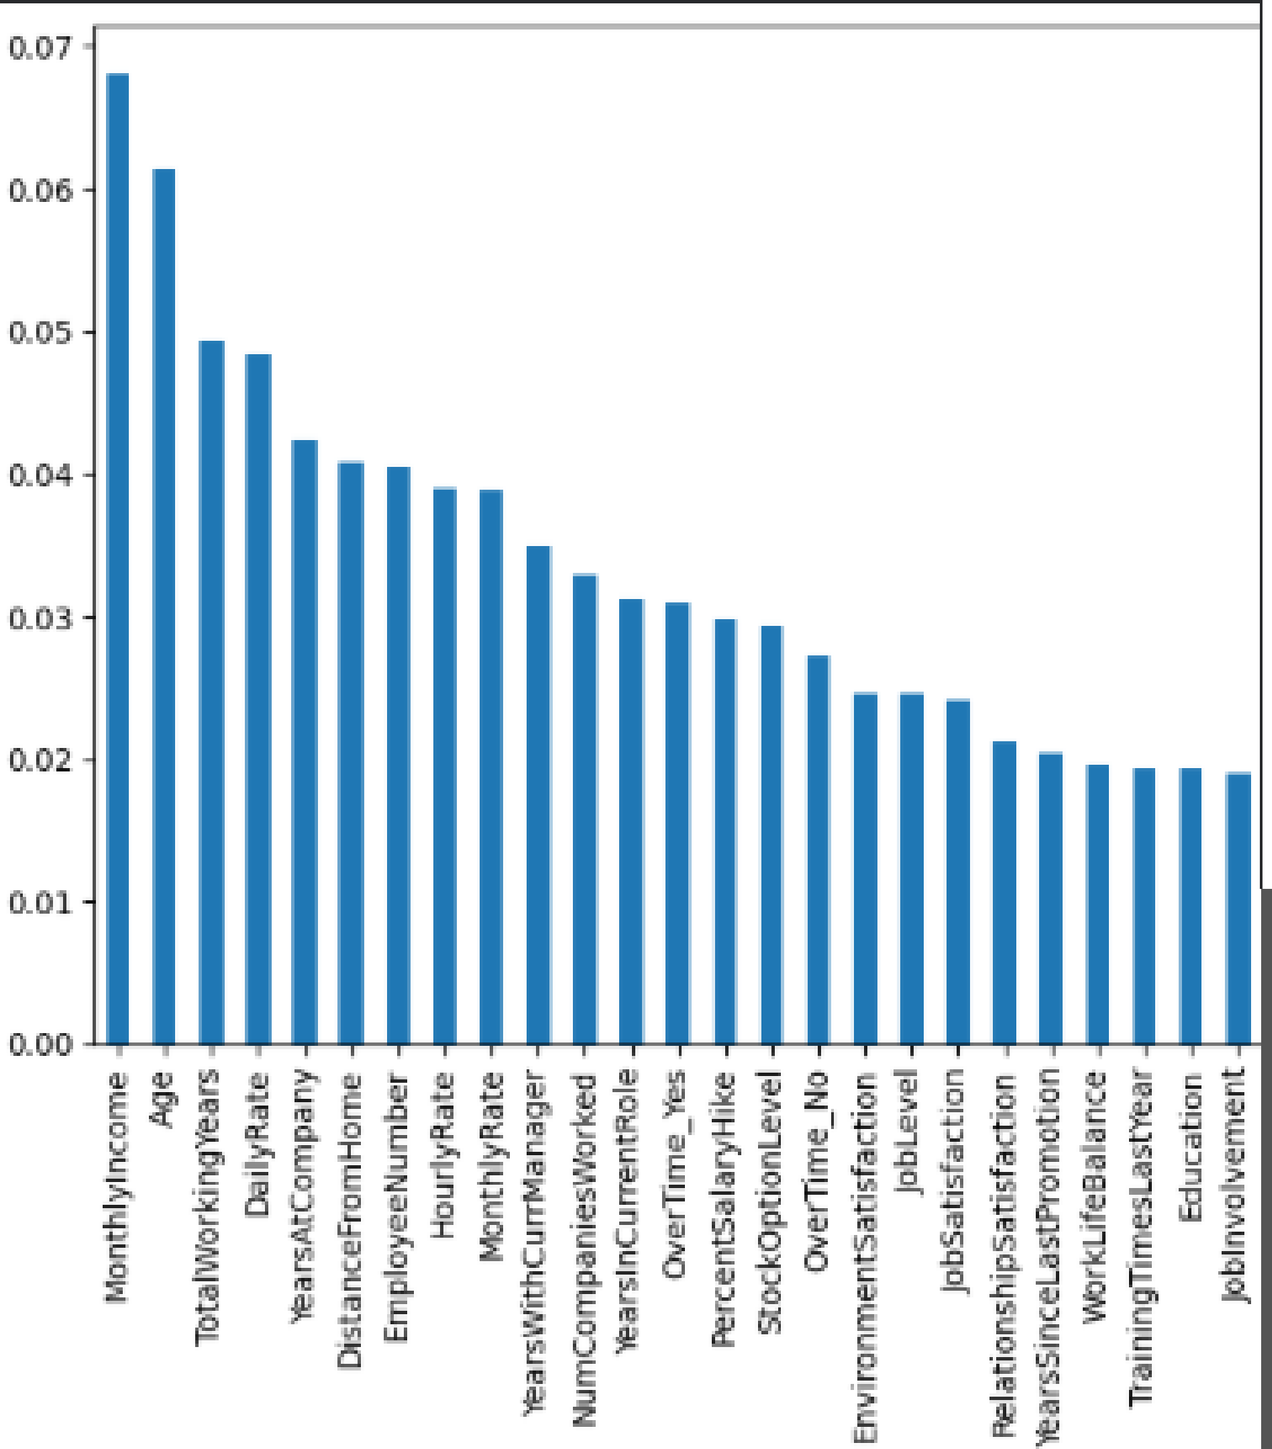
Test Size	Model	Precision	Recall	F1 Score	AUC
0.2	Logistic Regression	0.615385	0.340426	0.438356	0.810664
	Random Forest	0.833333	0.106383	0.188679	0.784434
	SVM	0.451613	0.595745	0.513761	0.806185
	XGBoost	0.769231	0.212766	0.333333	0.793178
	CatBoost	0.608696	0.297872	0.400000	0.792661
0.3	Logistic Regression	0.707317	0.408451	0.517857	0.822383
	Random Forest	0.636364	0.098592	0.170732	0.778493
	SVM	0.494253	0.605634	0.544304	0.807195
	XGBoost	0.640000	0.225352	0.333333	0.764636
	CatBoost	0.606061	0.281690	0.384615	0.759612
0.4	Logistic Regression	0.683333	0.431579	0.529032	0.824362
	Random Forest	0.764706	0.136842	0.232143	0.791673
	SVM	0.500000	0.652632	0.566210	0.815480
	XGBoost	0.729730	0.284211	0.409091	0.800448
	CatBoost	0.738095	0.326316	0.452555	0.804078

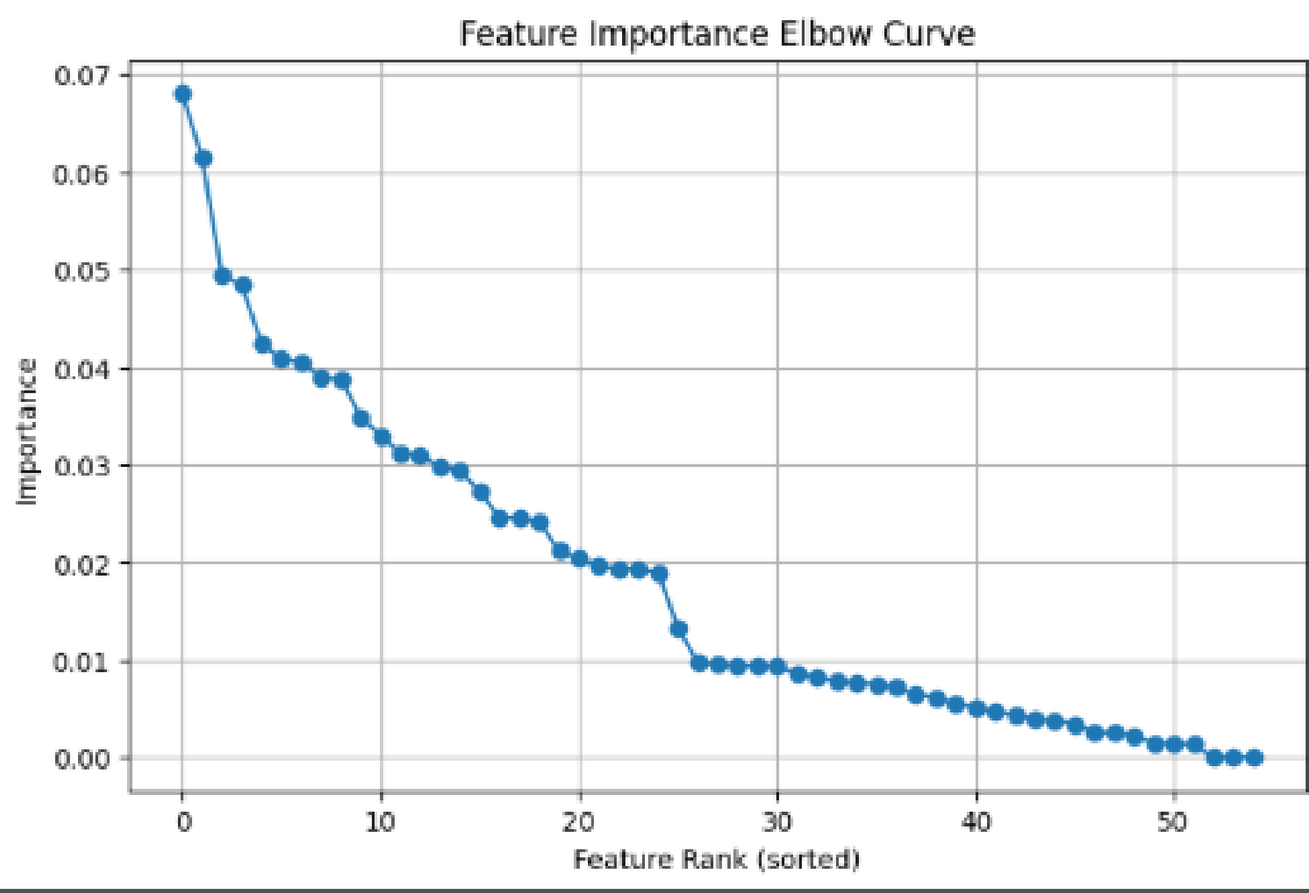
Conclusion Based On the ML Analysis

SVM achieved the highest F1-scores (0.51 - 0.56) across all test splits, showing the strongest balance between precision and recall. This means SVM correctly identifies more employees who truly attrited while keeping false alarms low. Therefore, SVM is the most reliable model for analyzing attrition patterns in this dataset.









- Top Features which affect the attrition rate mainly determined by the elbow plot on Random Forest

Why Random Forest?

because it not only performs well on tabular data but also provides feature importance scores, making it ideal for identifying the key drivers behind employee attrition

Insights (Power BI + ML)

- Sales roles exhibit the highest attrition, driven by heavy workloads and lower job satisfaction.
- Mid-career employees (36–45) are most likely to leave due to limited promotion opportunities and stagnation.
- Employees with <5 years at the company are more vulnerable to quitting, confirming early-tenure risk.
- Low relationship and environment satisfaction strongly predict attrition, highlighting the importance of manager support.
- Long commute distances and overtime hours consistently push employees toward resignation, impacting work-life balance.

Suggestions

- Reduce workload pressure in sales roles through resourcing, automation, or shift balancing.
- Create clear and timely promotion pathways to retain mid-career employees and prevent career stagnation.
- Strengthen onboarding and early employee support to improve retention within the first 2–3 years.
- Improve workplace culture and manager training to boost relationship satisfaction and employee engagement.
- Introduce flexibility options—hybrid work, remote days, or commute allowances—to support work-life balance.

THANK YOU!
